Health Information Technology

Global Medical Data Exchange

Palmetto Primary Care

Electronic Health Network will demonstrate how medical data can be exchanged on a global scale using Cisco MDES and CONNECT. EHN will show patient data being exchanged between Palmetto Primary Care Physician (PPCP) Specialists and a European physician. Second, EHN will show how the same patient's data can be shared with an epSOS compliant EMR if an American requires care while in Europe. The use case will illustrate a bi-directional exchange of medical data between providers from local to an international level using epSOS and CONNECT. The demonstration's overarching goal is to illustrate that the Nationwide Health Information Network can have access to American patient records established in both the U.S. and Europe.
